

# Check Your **VITAL** Signs!™

Just like a CAT Scan reveals a lot about your physical health, a thorough examination of your vehicle's most important components can reveal much about the health of your car!

## ✓ **ENGINE**

Engine oil is the lifeblood of your engine. Regular oil changes are usually not enough to prevent sludge and varnish deposits from building up in your engine, leading to increased wear and reduced performance.

## ✓ **POWER STEERING**

The ability to steer your vehicle is critical. yet most of us don't think about our steering system until a problem arises. Doesn't such a vital component deserve a little attention?

## ✓ **TRANSMISSION**

Every year more than 13 million transmissions fail. Higher operating temperatures, increased driving loads and time all work against your transmission's lifeblood - the fluid. That's why most car manufacturers recommend changing the fluid every 2 years or 24,000 miles (38,000 km).

## ✓ **COOLING SYSTEM**

Cooling System failure is the #1 cause of highway breakdowns. Checking and properly maintaining this component can prevent problems before they leave you stranded. Therefore, many car manufacturers recommend replacing your coolant every 2 years or 24,000 miles (38,000 km).

## ✓ **FUEL SYSTEM**

Periodic cleaning of your fuel system, every 15,000 miles (23,000 km) or annually, will help deliver the power and performance you desire, while reducing exhaust emissions and restoring fuel economy.

We adhere to the MAP standards of service.

**Ask for a complete check-up! It might be a matter of life and death ... for your car.**
